Das nehmen Sie mit

Most people are learning cloud skills nowadays, while even Microsoft says that 95% of their customers still have an Active Directory (AD) and operate in a Hybrid environment.

Especially young IT-people coming out of school and entering their first real jobs are suffering as they have not been given proper training in Active Directory (AD).

This course will level up your skills in how AD really works and how it should be designed, implemented, maintained and secured.

It's a good fit for young new IT-people entering the business, but also for seasoned admins to learn real world examples on how to protect and maintain AD.

This course contains real-world examples for companies sized between 1-550000 computers.

You should also remember that around 95% of Ransomware cases happen by paralyzing a company's Active Directory.

This course will also prepare people to correctly secure their AD, take care of backups and recover quickly.

The course instructor Sami Laiho has been working with and teaching Active Directory from when it was introduced. As a Microsoft MVP in both the Windows OS and Identity, he has unparalleled knowledge and experience in this topic.

Zielgruppen

People administering or starting to administer an Active Directory. People interested in how the crown jewels of any environment are properly managed and secured.

- Administratoren
